CyberSafe Awareness Website

Student Name: [Enter your name]
Project: Cyber Safety Awareness Website

1. Introduction

CyberSafe is an educational website designed to promote safe and responsible use of the internet. It introduces common cyber risks and provides simple guidance for everyday users.

2. Objectives

• Increase awareness of phishing and online scams.
• Encourage strong, unique passwords and OTP privacy.
• Promote safer browsing and personal privacy.
• Provide an interactive checklist and a short knowledge quiz.

3. Tools and Technologies

HTML is used for page structure, CSS for visual design and responsive layout, and JavaScript for quiz scoring and reset functionality. No external packages are required.

4. Main Features

The website includes safety information cards, a cyber safety checklist, a three-question quiz, a score message, and a try-again option. It is designed to work on phone and desktop browser sizes.

5. Methodology

The project was organized into three parts: designing the page structure, styling the content for readability, and adding JavaScript interactions for the quiz. The website is intended to run locally in a browser.

6. Testing Plan

Open index.html in a modern browser; verify that sections display; select checklist items; answer all quiz questions; check the score; and use Try Again to reset the form. Record actual results after performing these checks.

7. Limitations

This is an awareness website only. It does not scan websites, identify malware, or submit information to a server. The quiz is for learning and is not a formal cybersecurity assessment.

8. Conclusion

CyberSafe presents basic cyber hygiene guidance in a simple interactive format. It encourages users to pause, verify suspicious requests, and protect sensitive information.

Before submission: Replace the student-name placeholder and test the website on your device. Do not claim testing is complete until you have run the checks.
